1. Executive Summary

1.1 Project Overview

The HR Management System (HRMS) is a comprehensive web-based solution designed to modernize and streamline the management of human resource operations in small and medium-sized businesses. Many organizations still rely on spreadsheets, paper forms, and disconnected systems to manage employee information, leave requests, attendance, payroll, and performance reviews. These traditional methods are inefficient, time consuming, prone to human error, and often create delays in administrative processes.

The proposed HRMS addresses these challenges by providing a centralized digital platform that automates and integrates key HR activities such as employee data management, leave and overtime approval workflows, payroll processing, performance evaluations, onboarding, task management, and internal communication. The system is accessible through a web browser and supports different user roles including employees, team leads, department managers, HR managers, and system administrators. By digitizing and automating HR operations, the HRMS improves organizational efficiency, enhances employee self-service, supports better decision-making, and strengthens compliance and record accuracy.

1.2 Purpose and Scope of this Specification

The purpose of this project is to develop a web application that facilitates and automates the management of human resources within an organization. The system is intended to replace manual, paper-based, and fragmented HR processes with a secure, integrated, and user-friendly platform. It will enable employees to manage their own HR related activities, such as leave requests and payslip access, while allowing managers and HR staff to efficiently oversee approvals, payroll, reporting, employee performance, and compliance related activities.

This Software Requirements Specification (SRS) defines the overall scope, context, user roles, assumptions, constraints, and dependencies of the HR Management System. It serves as a reference for developers, stakeholders, instructors, and users by clearly documenting the intended functionality and operational environment of the software.

2. Product/Service Description

This section describes the general factors that influence the HR Management System and its requirements. It provides the background and context needed to understand why the system is being developed and what organizational needs it addresses.

2.1 Product Context

The HR Management System is designed for small and medium sized businesses (SMBs) and serves as a standalone web-based system accessible to employees, team leads, department managers, HR managers, and system administrators. Its purpose is to centralize and automate the core functions of human resource management, including employee lifecycle management, attendance and leave tracking, payroll administration, performance reviews, onboarding, document management, and internal communication.
The system enhances collaboration between employees, supervisors, HR personnel, and management by ensuring that all HR-related data and workflows are handled in one unified platform. It supports role-based access control so that each type of user can perform only the tasks relevant to their responsibilities. By replacing fragmented and manual processes, the HRMS improves data consistency, operational transparency, and decision-making across the organization.

2.2 User Characteristics

1. Employee
    - View and manage personal profile information.
    - Submit leave requests and overtime requests.
    - Clock in and clock out for attendance tracking.
    - View salary history and download payslips.
    - Access company announcements and notifications.
    - Upload and manage personal documents.
    - Book desks and complete onboarding tasks.
    - View assigned tasks and track their progress.
2. Team Lead
    - Perform all Employee level functions.
    - View time logs and leave requests of team members.
    - Recommend or review leave and overtime requests for first-level approval.
    - Assign tasks and monitor team performance.
    - Access team-related analytics and summaries.
3. Department Manager
    - Perform all Team Lead level functions.
    - Oversee all employees within a department.
    - Review and recommend leave or overtime requests for department members.
    - Access department level reports and workforce summaries.
    - Publish or manage department-specific announcements.
4. HR Manager
    - Perform all Department Manager level functions.

- Manage employee records, salary records, and payroll processing.
- Provide final approval for leave and overtime requests.
- Conduct and manage performance reviews.
- Configure leave types, holiday calendars, onboarding templates, and document categories.
- Generate reports related to attendance, payroll, headcount, and employee performance.

5. SuperAdmin

- Perform all HR Manager level functions.
- Manage user accounts, authentication, and role assignments.
- Access and review system wide audit logs.
- Configure global system settings.
- Perform administrative actions such as password resets and infrastructure-level configurations.

These users are expected to have basic digital literacy and the ability to interact with a modern web application. However, the complexity of system usage varies depending on the user role, with administrative roles requiring more advanced interaction with reports, configurations, and approval workflows.

2.3 Assumptions

- Employees, team leads, managers, and HR personnel will receive sufficient training to use the application effectively.
- The organization has the necessary IT infrastructure, including computers, internet access, and secure devices, to support system use.
- Employee records, salary information, leave balances, and attendance data will be entered accurately and maintained regularly.
- Employees will actively use the system for self service functions such as leave requests, document access, and attendance logging.
- Team leads and department managers will review and process approvals in a timely and responsible manner.
- HR managers will maintain updated employee records, payroll configurations, and organizational settings.
- SuperAdmin users will ensure proper user-role assignment and system-level governance.
- The organization will adopt the system as the primary HR platform instead of continuing parallel paper-based workflows.

2.4 Constraints

- The HR Management System requires a stable internet connection because it is a web-based platform.
- The effectiveness of the system depends heavily on user adoption and staff training.
- The performance and reliability of the application depend on the organization's hardware, network stability, and browser compatibility.
- Payroll accuracy depends on correct salary data, leave balances, overtime records, and deductions being entered into the system.
- Approval workflows are dependent on the timely response of team leads, department managers, and HR managers.
- Features such as PDF payslip generation, notifications, and document management rely on proper configuration and implementation of supporting modules.
- The system is constrained by the limitations of the selected web technologies, frameworks, and available development time.
- Security and privacy controls must be enforced to protect employee and payroll data from unauthorized access.
- The first version of the system is limited to a web-based platform only, without dedicated mobile applications.

2.5 Dependencies

- Employee profile management depends on the successful creation and maintenance of employee records by HR or administrative staff.
- Leave requests and overtime approvals depend on the active participation of team leads, department managers, and HR managers.
- Payroll processing depends on the availability and correctness of salary records, attendance logs, approved leave, approved overtime, and deductions.
- Time tracking depends on employees consistently clocking in and clocking out through the system.
- Performance review workflows depend on managers and employees completing review forms and assessments on time.
- Onboarding processes depend on HR managers creating templates and assigning checklist items to new employees.
- Task management depends on team leads and managers creating and updating tasks for employees.
- Document management depends on users uploading required documents and HR maintaining document categories and validity dates.
- Notification and announcement features depend on administrators and HR staff publishing relevant updates through the platform.
- Audit logging and compliance tracking depend on all system interactions being properly recorded and preserved by the backend system.
